SECTION J: NATIONAL ACCOUNTS

In Principle, in the measurement of national accounts aggregates three basic approaches may be applied depending upon the available statistics, i.e. production, income and expenditure approaches.

(I) ***The production approach****: takes production as the total value of goods and services less intermediate inputs originating in the various industries which make up the economy.*

(Ii) ***The income approach****: considers production as the sum of the incomes received by those producing these goods and services.*

(iii) ***The expenditure approach****: sums up the value of the final uses of goods and services reduced by the value of imports of goods and services.*

In Ethiopia's National Accounts, the production approach has been mainly used but the expenditure approach is applied in the case of Public Administration and Defense, Education, Medical and Health Services. The income approach is hardly used except in some service sectors such as domestic services. The total value of goods and services thus arrived at has been given according to the industry producing them. However, no breakdown by type of factor income has been attempted. In the expenditure side of Ethiopia's National Accounts private consumption expenditure was arrived at by utilizing information from rural and urban consumption surveys conducted by the Central Statistical Authority over the years.

Since the reference period for the government budget and plans in general is the Ethiopian Fiscal Year (E. F. Y.), in order to facilitate the monitoring and evaluation of plan implementation it has been decided to change the reference period of national accounts data from G. C. Y. To E. F. Y. Accordingly, all national accounts tables except the Rest of the World Accounts, have been complied in the E. F. Y.
The concepts and definitions of major aggregates used in the National Accounts are given below.

Gross Domestic Product (GDP) at Market Prices*: is the market value of the goods and services produced within the territory of Ethiopia, before any allowance is made for the*

consumption of fixed capital. It is equal to the sum of consumption expenditure by private consumers and government, gross domestic capital formation, and net export of goods and services.

Gross Domestic Product (GDP) at Factor Cost*: is the sum of income accruing from the production of goods and services. It differs from the Gross Domestic Product at Market Price by the amount equal to indirect taxes less of subsidies.*

Gross National Product (GNP) at Market Prices*: is the market value of goods and services before deduction of provision for the consumption of fixed capital, attributable to the factors of production supplied by residents of Ethiopia. It is equal to the sum of consumption expenditure, gross domestic capital formation, and net export of goods and services plus net factor income received from abroad. It differs from the Gross Domestic Product at Market Prices by the amount of net factor income from abroad.*

Net Factor Income from Abroad*: is excess of factor incomes (interest, dividends, profits, etc.) paid abroad over factor incomes received from abroad.*

Private Consumption Expenditure*: is the value of goods and services (purchased or self-produced) consumed by households and private non-profit institutions plus the net value of gifts in kind received from abroad.*

Government Consumption Expenditure*: represents the current expenditure on goods and services by central and municipal government. It comprises compensation of employees, purchases by government from local enterprises and from abroad, less sale by government of goods and services. Government consumption expenditure excludes transfer payments, interest paid by government and subsidies.*

Gross Fixed Capital Formation*: includes the value of the purchases and own account construction of fixed assets (land, civil construction and works, machinery and equipment) by enterprises, households, private non- profit institutions and government.*
